

Direct Operated Pressure Sequence Valve

Model: DZ5DP...1X

- ◆ Size 5
- ◆ Maximum working pressure 315 bar
- ◆ Maximum working flow 30 L/min

Technical parameters	04
Component size	04

Features

- Direct operated sequence valve
- 5 pressure ratings
- Subplate mounting
- Panel mounting
- 3 adjusting elements:
 - Rotary knob
 - Internal hexagon adjusting screw with protective cap
 - Lockable rotary knob with scale
- Check valve, optional

Function description, sectional drawing

The DZ5DP pressure control valve is a direct operated sequence valve, it is used to set the pressure to supply oil to the secondary system.

The valve is composed of valve body (1), control spool (2), spring (3), pressure setting element (4) and optional check valve (5) as required, the pressure is setting via the pressure setting element (4).

The spring (3) holds the control spool (2) in the initial position. The pressure oil in port P acts to the spool area opposite to the spring (3) via the hole (6) and the throttle hole (7). When the pressure in port P reaches the setting value, the spool moves against the spring force so that the port P and the port A are connected. At that time, the oil flows into the system connected to port A, but the pressure in port P does not fall, and the control oil can also supply external via port X.

Depending on the application of the valve, the pilot oil can return externally via port Y(T) or internally. The check valve (5) is installed as required to allow the fluid flow back freely from port A to port P.

Model DZ5DP-1-1XJ/
