Features

- Valve poppet with or without damping nose
- 2 area ratios
- 4 types of springs
- 4 stroke limitations
- Control cover with integrated seat valve
- Control cover with integrated shuttle valve
- Control cover for set-up of directional spool valves with or without installed shuttle valve
- Control cover for set-up of directional seat valves with or without installed shuttle valve

Function description, sectional drawing

The 2-way logic cartridge valves are designed as components for integrated blocks. The main valve component with oil ports A and B is installed into the control block in a receiving hole standardized according to DIN ISO 7368 and closed with a cover. In most cases, the control cover is the connection between the control side of the main valve component and the pilot valve.

By control with respective pilot control valves, the main valve component can be applied for pressure, directional and throttle functions or a combination of these functions. The special economical structural designs can be achieved by matching the size of various flows of the valves and the actuators. If the main valve component can undertake more than one function, the special economical structure can be achieved.

Directional function

The 2-way logic cartridge valves generally consist of control cover (1) and cartridge element (2). The control cover contains control holes, optional stroke limitation according to function, hydraulic control directional seat valve or shuttle valve. In addition, the directional spool valve or directional seat valve can be installed onto the control cover. The cartridge element mainly includes valve sleeve (3), adjustment ring (4) (only applicable to size 32), seat valve (5), optional damping (7) and reset spring (8).

Function

The function of 2-way logic cartridge valves depends on the pressure. Therefore, there are three important pressure-bearing areas A1, A2, A3 for actuation of the valve. The area of the valve seat A1 is taken as 100%. Depending on the type, the annulus area A2 is 7% or 50% of the area A1. Therefore, the area ratio A1:A2 is either 14.3:1 or 2:1. The area A3 is equal to A1+A2. Due to the different area ratios A1:A2, the annulus area A2 is also different. The area A3 may be 107% or 150% when 100% area at seat A1.

Basic application

The areas A1 and A2 are operated in the opening direction. The area A3 and the spring are operated in the closing direction. The effective direction generated by the combination of the opening and closing directions determines the position of the spool of the 2-way logic cartridge valve.

The oil can flow from A to B or B to A through the 2-way logic cartridge valve. When the area A3 is compressed by the pilot oil of channel B or external pilot oil supply, the channel A is closed without leakage."

Size 16 to 32

Size 40 to 63

Component size

Size unit: mm

Control cover and installation hole according to ISO 7368

1 Depth of fit

2 Reference dimension

3 If the diameter of port B is not $\Phi D3$ or $(\Phi D3^*)$, then the distance from the cover support surface to the center of the hole must be calculated.

4 Port B can be installed around the central axis of port A, but it must be ensured that the installation hole and pilot hole are not damaged

5 Locating pin hole

6 The length L1 (x-y axis of the hole) of the control cover (with directional valve) is 80mm for size 16.

7 If $D \leq 45\text{mm}$, H8 is allowed to be installed.

Logic cartridge valves functional symbols

Technical parameters

Maximum working pressure	without directional valve	bar	420
	port A, B, X, Z1, Z2	bar	315;350; 420 (dependent on the attached directional valve)
	port Y	bar	Depending on the return oil pressure of the directional valve
Pressure medium			Mineral oil - for NBR seal or FKM seal Phosphate ester - for FKM seal
Pressure medium temperature range		°C	-30 to +80 (NBR seal) -20 to +80 (FKM seal)
Viscosity range		mm ² /s	2.8 to 380
Cleanliness of oil			The maximum allowable pollution level of oil is ISO4406 Class 20 / 18 / 15 ¹⁾

¹⁾ The oil must meet the cleanliness degree requested by the components in the hydraulic system. Effective oil filtration can prevent failure and increase the service life of the components.
